

## Grow your own gummy bear science

### You will need

- 4 gummy bears
- white vinegar
- salt
- 3 cups
- cold water

1. Put white vinegar in the first cup. Cold water in the second cup, and very salty water in the third cup.
2. Put one gummy bear in each cup.
3. Leave them for 3 hours and see if you notice anything happening. Tell somebody what you notice.
4. Leave your bears overnight and see if anything has changed in the morning.

You could design your own experiment by putting bears in different liquids. You could try food colouring, hot water, milk or baking soda.

Please send us a photo so we can see your results.

Have fun scientists.
